

CODE PIPELINE WITH ELASTIC BEANSTALK

1. Create an environment of NODE.JS by using elastic bean stalk.
2. Show them the output by clicking on link
3. Download a basic nodejs code form below link:
<https://docs.aws.amazon.com/elasticbeanstalk/latest/dg/samples/nodejs.zip>
4. Code commit -- > source -- > create Repo -- > select repo and clone url -- > clone HTTPS
5. Open git bash -- >
6. git clone <https://git-codecommit.us-east-1.amazonaws.com/v1/repos/zepto>
7. Now it will ask for credentials
8. Create an IAM role and administrator access
9. Open the user and get HTTP git creds
10. Now it will get repo go to repo inside and check: it will show Sumit
11. Open your local drive and open that path by selecting any file
12. Now you will find zepto there
13. Place your python code on that zepto repo all files
14. Now you will see all of those on git bash use ll command
15. Change application.py and commit those and give git push, all files will be pushed.
16. Pipeline -- > create -- > name -- > next -- > provider: aws code commit -- > repo name : zepto
17. Branch -- > master -- > next -- > skip build stage -- > Deploy provider : elastic beanstalk
18. Application name -- > environment name -- > next -- > create pipeline
19. Now see the page it will be changed
20. Modify one more time and commit and give git push it will be automatically deployed.
